

Advanced Data Retrieval

Christian Wenz

Consultant, Software Architect

@chwenz

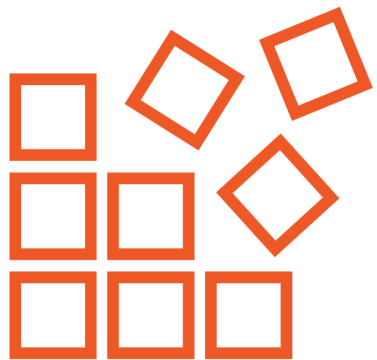

Pain Points

Missing convenience/performance features (caching, pagination)

Clumsy state management

Ceremony

React Query

<https://react-query.tanstack.com/>

Console

```
npm install react-query
```

Application

```
import
  { QueryClient, QueryClientProvider }
  from "react-query";

function App() {
  return (
    <QueryClientProvider
      client={queryClient}>
      ...
    </QueryClientProvider>
  )
}
```

```
const query = useQuery(
  "events",
  () => axios.get(url)
);

// query ==
// { status, data, error, isLoading }

if (isLoading) {
  return ( <div>Loading ...</div> );
}

return (
  query.data.map(...)
);
```

◀ **React Query hook**

◀ **Hook key**

◀ **Async function returning Promise**

◀ **Structure of returned data**

◀ **Message while loading**

◀ **Output once data is available**

Pagination

**Update API
(page parameter)**

**Add page state
variable**

**Add UI to go to
another page**

```
const mutation = useMutation(  
  id => dispatch(addCart(id)),  
  {  
    onSuccess: (data, variables, context) => {}  
  }  
);  
  
{ mutation.isSuccess ? <span>Success!</span> : null }
```

Mutations

Act upon completion of API calls

SWR

<https://swr.vercel.app/>

Console

```
npm install swr
```

Application

```
function fetcher(...args) {  
  return fetch(...args).then(  
    res => res.json());  
};  
  
const { data, error } =  
  useSWR("/cart", fetcher);
```

```
import { mutate } from "swr";

function addCart(id) {

  fetch(
    "/cart",
    { method: "POST", body: `{"id": ${id}}` }
  )

  .then(() => { mutate("/cart") });

};
```

Mutations

Simplify the cart logic

Summary

Using React Query

Using SWR
